The full project build instructions here:
https://www.instructables.com/ESP8266-Weather-Widget-V20/

Did not like the case/housing available and wanted to make my own and customize it!
Code for display/esp (has instructions on how to setup/configure, including generating API Key from openweathermap.org to get weather data):
https://github.com/ThingPulse/esp8266-weather-station-color

Key components needed:

1. 2.8" TFT display

2. ESP8266 or ESP32 Wemos D1 Mini or clone.
3. 22AWG (or thinner) wires and some basic soldering skills and equipment
4. API Key from openweathermap.org (free)

The back cover slides and is a snug fit. So, play with the tolerances. 0.2mm is what I used in the design and worked great for me.
Just hot-glue the display and the ESP. No screws or screw holes etc.

Fusion design files attached - so that you can download and customize it as needed.
